

**The
SIA+
Process**

FLIP OVER

What is SIA+?

Innovation remains a key driver for business success, as businesses embrace technology to help them streamline their operations, boost internal processes and become more agile, increasing their service offering. Technology has been the great enabler for many, changing the way in which businesses and employees operate. With the advent of super-fast broadband, social media and the cloud, the nature of technology has fundamentally changed, as has our approach when applying it to our business.

Convenience has become the key driver,
but when it comes to security, convenience comes at a price.

How will SIA+ help my business?

SIA+ (*Security Intelligence Audit*) is designed to establish your business IT security, where your vulnerabilities lie and what poses the biggest challenges to your business-critical processes. Understanding the need for security and legislation, the SIA+ approach will highlight your key threat vectors whilst applying knowledge around legislation and regulations, ensuring that your business remains both compliant and safe.

How much will SIA+ cost?

£1,950 +VAT

SIA+ provides a transparent security offering at a fixed price point. The SIA+ package is competitively priced at £1950.00 and carries no hidden costs.

What will I get for my money?

The Security Intelligence Audit will allow you to better understand your businesses data processes, employed technology and where your core vulnerabilities lie, regarding both IT security and Governance legislation.

Utilising a myriad of security lessons and best practices, SIA+ employs a multi-phase approach, working with your management team to understand your systems, benchmarked against government backed Cyber Security certifications and International Information Security Standards.

Using the information garnered from the audit, a vulnerability scan will be conducted, identifying the most likely points of entry and measuring the robustness of your systems in its ability to secure data and prevent a cyber enabled attack.

SIA+ will then provide expert onsite consultancy in the form of an ISACA certified consultant, who will explain where your security weaknesses lie and what can be done to best remedy them.

Questionnaire

Blending together the government led Cyber Essentials scheme, ISO27001 Information Security standard and the experience garnered through thirty years of industry best practice, this self-assessed questionnaire to be completed by the relevant members of staff will help identify data flow, security protocol and your company policies pertaining to security.

On Site Audit

A certified IT security professional will visit the site to verify the information collected within the audit. They will build an asset inventory and record key IP numbers, allowing the network to be tested offsite to check its resilience from an external attack.

Vulnerability System Scan

Using the information gathered on site and utilising best of breed software, experienced information security personnel will probe your network and devices, conducting scans to highlight weaknesses within your IT infrastructure, possible attack vectors and methods of entry.

Security Consultant

The approach to information security must make commercial sense. We apply a pragmatic and holistic view to Information Security, providing expert consultancy to talk through the results of our findings and alerting you to where the biggest threats to your business exist.

Security Intelligence Report

We will build you an in-depth report, which will highlight your key vulnerabilities, steps that can be made to remedy these and recommendations, both from a process perspective and through the employment of new technology. This report can form part of your technology roadmap, helping create a more robust and safe working practice for your company, your clients and your employees.
